

## **DPF – Diesel Particulate Filter Maintenance & Treatments -- ECOFuelMax**

Since 2007 Diesel Motors in the United States are plagued with DPF Maintenance issues. Trapping Soot & Carbon Particulates is necessary but it clogs filters and can reduce fuel efficiency.

By: [ECO Fuel Systems, LLC](http://ECO Fuel Systems, LLC)

**PALM BEACH, Fla. - July 9, 2021 - PRLog** -- A Diesel Particulate Filter (DPF) is a ceramic filter with thousands of holes to trap Carbon Particulates before released into the air. The Soot and Particulates are un-burnt fuel. Diesel motors that stop and go like School Buses, Transit Buses and Waste Vehicles experience a greater occurrence of clogged filters.

All Diesel motors since 2007 will experience the need for DPF maintenance. Many ask is there a way to totally eliminate DPF maintenance? The answer is legally No; but there are treatments like additives and fuel filters that can help.

There are over 20 fuel additives that all claim to work. The negatives are that they require adding it regularly to the fuel. The other negative is the continued cost, on average +/- \$10.00 per fill up.

The most efficient proven and guaranteed solution is the ECOFuelMax, it is an in-line fuel filter/enhancer that increases fuels vapor pressure causing it to burn cleaner and more efficiently. No warranty issues. The ECOFuelMax system costs \$295 to \$495 (depending on motor size) and can last 20+ years, It is guaranteed, no risk you can get your money back, BBB A+ rated.

When a DPF gets clogged you have a few options to clean your filter. The first plan available is having a company heat it and remove the Carbon. The cost \$350 to \$600 plus labor. Cleaning a DPF at 1800 degrees can crack the ceramic median and the filter needs to be replaced. A new DPF costs +/- \$3000.

In the last few years by accident a Transportation Manager who had some Cobra Clean to remove the faded yellow paint from his School Buses took some home to clean his BBQ grill. Cobra Clean is a Biodegradable non toxic – non acidic cleaning solution. He was impressed seeing the carbon melt from his grill. When he returned to his shop he took a standard dirty 14 inch DPF filter and soaked it in a tub of Cobra Clean over the weekend to see what happens. After rinsing the filter he was shocked the carbon melted and rinsed out with tap water leaving a clean like a new Diesel Particulate Filter. That is how Cobra Clean has become a leader in cleaning DPF's without damaging heat. The cost is approximately \$85, 75% less that heat cleaning.

After years ECO Fuel System, LLC has joined in helping many reduce Carbon Pollution/Particulates as well as reducing Maintenance Expenses and Fuel Consumption. For more information call on go-online <https://ecofuelmax.com> we are always happy to share reports, results and references.
